# Hedging for Canadian Disinflation and Recession

## Owning September 2024 CORRA and Canada 10Y Futures

The Bank of Canada (BoC) is likely to cut the policy rate more than currently implied by the Three-Month CORRA Futures (CRA™; Bloomberg: CORU4) curve. As it stands, 163bps of cuts are priced within the next two years. This is over 200bps shy of the cutting cycles that occurred following the 2000 hiking cycle and Global Financial Crisis (GFC). As a result, there is value in owning the September 2024 Three-month CORRA Futures contract.

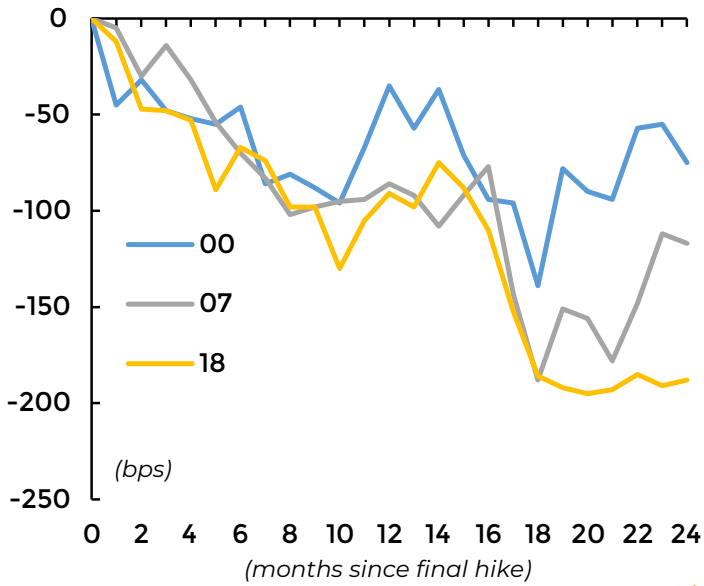

Further along the Canadian bond curve, there is value in owning the Ten-Year Government of Canada Bond Future (CGB™; Bloomberg: CNA). That is because the Canadian economy is likely to underperform current expectations. Historically speaking, the Canadian 10-year yield has fallen by at least 150bps over the past three cutting cycles (Figure 2). The macro rationale for this view is laid out below.

## Macro Rationale

### The Inflation Trend

On Canadian inflation, we find that services inflation momentum is quickly moderating (Figure 3). Monthly readings averaged +0.24% MoM through Q4, down from +0.43% MoM in Q3 and +0.69% in Q2. Meanwhile, core inflation momentum is slowing, suggesting the peak in core inflation is forthcoming despite inflation expectations proving hard to budge (Figure 4).

Admittedly, wage growth has yet to decline. But this could prove less inflationary if productivity rises. Currently, it is well below trend (Figures 5 and 6).

## Recession risks

On growth risks, Canada faces a leverage issue. Canadian households have added more debt to their balance sheet than income since the GFC (Figure 7). Specifically, they have concentrated on mortgage loans, helping to inflate Canadian house prices (Figures 8 and 9). Meanwhile, US households have improved the health of their household balance sheets. As a result, Canadian households are nearly twice as levered as they were in the GFC, and in comparison to American households now. This adds to potential recession risks later in 2023.

## What next for BoC and Canadian yields?

Given the inflation backdrop and recessions risks, the most recent BoC hike by 25bps to 4.50% at its January 25 meeting could be the last in this hiking cycle. In total, the BoC has hiked by a historical pace of 425bps during this hiking cycle, which started in March 2022. The next BoC meeting could see the central bank's rhetoric shift to a conditional pause, spurred by the suggestion that 'core inflation has peaked'.

For the BoC to hike again, Governor Tiff Macklem would need to see an 'accumulation' of evidence suggesting that economic data momentum is turning positive. But their base case is services disinflation, moderating wage growth with a pickup in services productivity, and easing labour market tightness.

Another reason for not expecting the BoC to hike again is that they typically end their hiking cycle 75bps below peak Federal Reserve (Fed) policy rates. Assuming market expectations for the Fed are correct at 5%, this would imply that the BoC has already hiked more than history would suggest (Figure 10).

If our view of peak BoC and weakening growth is correct, investors could hedge by going long:

- a) September 2024 Three-Month CORRA Futures (CRA; Bloomberg: CORU4).
- b) Ten-Year Government of Canada Bond Futures (CGB; Bloomberg: CNA).
